

Document Collaboration Plugin for Workbench

www.bluedog.net | Tom Termini tomtermini@gmail.com | tel 301-649-5000

Workbench is a project management application written in Ruby on Rails. Users of Workbench often collaborate with me and other members of the team on documents. At the moment, we use GoogleDocs or Word documents passed around. The plugin would be available to projects so project members could collaborate on rich text documents in .odt, .doc, or .docx formats within the browser. They could share documents inside the Workbench instance or using the public link, setting up an expiration date and password, if needed.

Features:

Use the project members for access control and permissions

Upload /embed images

Export to .rtf .odt, or .docx

Overview: Collaborative Document Plugin for Redmine
